# Fiscal stimulus, credit frictions and the amplification effects of small firms

Pedro Juarros

Georgetown University

September 25th, 2020

#### Motivation

▶ We care about *output* (Y) after a fiscal stimulus (G)

Fiscal Multiplier 
$$(FM) = \frac{\Delta Y}{\Delta G}$$

- ► Empirical evidence: multipliers can go from as low as 0.5 to larger than 2 (Ramey, 2011; Auerbach & Gorodnichenko, 2012)
- No such a thing as a unique fiscal multiplier, it depends on the characteristics of the economy

#### Motivation

- ightharpoonup Firm dynamics facts: small firms  $\neq$  large firms
  - 1. Contribute disproportionately to output growth (Haltiwanger et al, 2014)
  - 2. Cyclically more sensitive than large firms (Fort et al, 2013)
  - 3. Different investment, revenues and financing dynamics along the business cycle (Dinlersoz et al, 2019)

#### Research question

Given these empirical facts about heterogeneity across small and large firms,

► How does firm size heterogeneity affect the fiscal multiplier?

► Are fiscal spillover effects heterogeneous by firm size?

#### Main Contributions

- 1. Novel determinant: the local FM increases with the share of small firms
  - ▶ Neoclassical and NK theories: representative firm (Ramey19'; Nakamura & Steisson14')
- 2. Positive spillovers for small firms and neutral for large firms
  - Small firms increase operating revenues, investment and financing relative to large firms → challenge the established view that ↑ G crowd-out investment and credit (Auerbach et al, 2020; Murphy & Walsh, 2018)
- 3. National fiscal multiplier and the share of small firms

Proposed mechanism: Financial Accelerator

#### Outline

1. Macro evidence: output responses to G shocks at MSA level,  $(\gamma^{macro})$ 

2. Micro evidence: firm level responses to local fiscal stimulus,  $(\gamma^{micro})$ 

3. Model to quantitatively assess the proposed mechanism and provide a link between national fiscal multipliers and small firms  $(\gamma^{nat})$ 

# MSA level responses

1. Macro evidence:

#### How does firm size heterogeneity affect the local fiscal multiplier?

$$\frac{Y_{m,t+1} - Y_{m,t-1}}{Y_{m,t-1}} = \beta \frac{G_{m,t+1} - G_{m,t-1}}{Y_{m,t-1}} + \gamma \frac{G_{m,t+1} - G_{m,t-1}}{Y_{m,t-1}} \times (S_{m,t-1} - \bar{S}) + \eta S_{m,t-1} + \delta_m + \delta_t + \epsilon_{m,t}$$

- $ightharpoonup Y_{m,t}$ : real GDP of MSA m (BEA),
- $ightharpoonup G_{m,t}$ : federal DOD contracts allocated to MSA m, (Demyanyk et al, 2019)
  - ▶ 50% of discretionary G and 18% of G
- ►  $S_{m,t-1}$  log-employment share of small firms (×100), and  $\bar{S} = \sum_{m}^{M} \sum_{t}^{T} \frac{S_{m,t}}{n_{M}n_{T}}$ , (< 250 employees Business Dynamic Statistics)
- Interpretation:  $\beta+\gamma$  is the local FM of increasing the employment share of small firms by 1% above the average

#### Identification assumptions

▶ IV: heterogeneous sensitivity across MSA's to variation in federal (aggregate) military spending  $(s_m)$ :

$$s_m \frac{G_{t+1}^{agg} - G_{t-1}^{agg}}{Y_{m,t-1}}$$

$$s_m = \sum_t^T (G_{m,t}/G_t)/n_T$$

▶ IV: 20-year lagged firm entry  $(S_{m,t-20}^{new})$  (Gourio et al, 2016)

Exclusion restriction: correlation between  $s_m$  and  $S_{m,t-20}^{new}$  is -0.005 (p-value = 0.72) First stage coeff: 0.08\*\*

#### How does firm size heterogeneity affect the local fiscal multiplier?

$$\frac{Y_{m,t+l} - Y_{m,t-1}}{Y_{m,t-1}} = \beta \frac{G_{m,t+l} - G_{m,t-1}}{Y_{m,t-1}} + \gamma \frac{G_{m,t+l} - G_{m,t-1}}{Y_{m,t-1}} \times (S_{m,t-1} - \bar{S}) + \eta S_{m,t-1} + \delta_m + \delta_t + \epsilon_{m,t}$$

2. Micro evidence:

Firm level responses

#### Are spillover effects heterogeneous by firm size?

- ► Firm panel data from ORBIS with both, **small and large**, unlisted and listed firms for 1997-2016
- Spillovers: firms that did not receive a military contract
  - Match contract level data from USAspending.org with ORBIS
- ► G shock: federal military contracts aggregated at state level
- Firm *i* in state *s* headquartered on the state where the fiscal stimulus takes place (Cohen et al, 2011; Kim & Nguyen, 2020)

#### Small firms are different from large firms and military contractors

Liquidity - Small

#### Taking stock of the evidence

▶ Macro: the local fiscal multiplier increases with the share of small firms,

$$\gamma^{macro} > 0$$

▶ Micro: small firms increase operating revenues, investment and financing relative to large firms,

$$\gamma^{micro} > 0$$

Proposed mechanism

Stimulus improve small firms' balance sheet and the value of the collateral, reducing credit spreads that leads to an increase in borrowing and investment

# 3. Model

 $\gamma^{macro} > 0$ ?  $\gamma^{micro} > 0$ ?  $\gamma^{nat} > 0$ ?

Model: Financial accelerator (BGG99) + Open economy New Keynesian model (NS14)

- 1. Two regions, i = H, F (a small home region, H, (n) and a larger "rest of the union", F, (1 n))
- 2. Credit friction  $(R^K \ge R)$ , R risk-free interest rate;
- 3. Two types of firms: Small and Large, which differ in the riskiness of investment projects, leverage and credit spreads
- 4. Households (HHs): consume ( $C = (C_H, C_F)$ ), supply labor (H) and deposit savings in financial intermediary (D);
- 5. Financial intermediary: are competitive, take deposits from HHs and lend to firms;
- 6. (Federal) Government: lump-sum taxes (T), spending in each region  $(G_i)$  and Monetary policy rule;

#### Model - Credit friction

- Firm's finance investment with internal (N) and external funds (B):  $B_{jt+1} = P_{jkt}K_{jt+1} N_{jt+1}$ , with j = s, l
- ▶ Idiosyncratic shock:  $F(\omega_j)$  with j = s, l and  $\sigma_{\omega,s}^2 > \sigma_{\omega,l}^2$
- $ightharpoonup \omega$  is private information, Lender must pay  $\mu$  to observe  $\omega$
- ▶ Optimal contract is  $\bar{\omega}$  such that:

$$\bar{\omega}_{jt}R_{jt}^K P_{k,jt-1}K_{jt} = Z_{jt}B_{jt}$$

#### Model - Credit friction

Firm's problem (E1):

$$\underset{\{K_{jt},E_{t-1}\bar{\omega}_{jt}\}}{\mathsf{Max}} E_{t-1} \int_{\bar{\omega}_{jt}}^{\infty} \left[ \omega_{j} R_{jt}^{K} P_{kjt} K_{jt-1} - Z_{jt} B_{jt} \right] dF(\omega_{j})$$

subject to,

$$R_t(P_{k,jt-1}K_{jt}-N_{jt}) = \left[\bar{\omega}_{jt}\int_{\bar{\omega}_{it}}^{\infty} f(\omega_j)d\omega_j + (1-\mu_j)\int_0^{\bar{\omega}_{jt}} \omega_j f(\omega_j)d\omega_j\right] R_{jt}^K P_{kjt-1}K_{jt}$$

► Let

$$\left[ar{\omega}_{jt}\int_{ar{\omega}_{jt}}^{\infty}f(\omega_j)d\omega_j+(1-\mu_j)\int_0^{ar{\omega}_{jt}}\omega_jf(\omega_j)d\omega_j
ight]=\left[rac{1}{\Gamma(ar{\omega}_{jt+1})-\mu_jA(ar{\omega}_{jt+1})}
ight]$$

► Capital expenditures are proportional to firm's net worth

$$E_t\left[\frac{R_{jt+1}^K}{R_t}\right] = E_t\left[\frac{1}{\Gamma(\bar{\omega}_{it+1}) - \mu_i A(\bar{\omega}_{it+1})} \left(1 - \left(\frac{P_{kjt} K_{jt+1}}{N_{it+1}}\right)^{-1}\right)\right]$$

#### Definition of equilibrium

- ▶ Given  $F(\omega_j)$ , a competitive equilibrium is a sequence of allocation and price functions,  $\{C_{it}, C_{it}^e, H_{ijt}, D_{it}, W_{it}, Y_{ijt}, K_{ij,t+1}, B_{ijt}, P_{kijt}, R_{ij,t+1}^K, R_{t+1}, G_{it}, T_t, \bar{\omega}_{ijt}\}_{t=0}^{\infty}$ , for i = H, F and j = s, I; such that:
- 1. Household solve  $\max_{\{C_{t+j}, H_{t+j}, D_{t+j}\}} E_t \sum_{j=0}^{\infty} \beta^j U(C_{t+j}, H_{t+j})$  s.t,  $P_t C_t + D_{t+1} = W_t H_t + R_t D_t T_t + \Pi_t$
- 2. Entrepreneur *j* solves *E*1;
- 3. Capital producers solve  $\frac{\textit{Max}}{\{\textit{K}_{jt+1},\textit{I}_{jt}\}} \textit{E}_0 \sum_{t=0}^{\infty} \beta^t [\textit{P}_{jkt} \textit{K}_{jt} \textit{I}_{jt} \tilde{\textit{P}}_{jkt} \textit{K}_{jt}] \text{ s.t.}$   $\textit{K}_{jt+1} = \phi_j \left(\frac{\textit{I}_{jt}}{\textit{K}_{it}}\right) \textit{K}_{jt} + (1-\delta) \textit{K}_{jt}$

4. Government budget: 
$$nP_{Ht}G_{Ht} + (1-n)P_{Ft}G_{Ft} = T_t$$

- 5.  $Y_t = nY_{Ht} + (1-n)Y_{Ft};$   $Y_{it} = C_{it} + I_{it} + G_{it} + \sum_j \mu_j \int_0^{\bar{\omega}_{jt}} \omega_j dF(\omega_j) R_{jt}^K P_{jk,t-1} K_{jt};$  $C_t = [n(C_{it} + C_{it}^e) + (1-n)(C_{it}^* + C_{it}^{e*}); I_t = [nI_{it} + (1-n)I_{it}^*]$
- 6.  $\sum_{i} (Q_{ijt} K_{ij,t+1} N_{ij,t+1}) = \sum_{i} B_{ij,t+1} = D_{it+1}$

Local Fiscal Multiplier: Ratio of Model-Data explained		13.	1%
[Min; Max]		[10.2%;	17.0%]

#### National multiplier and Small firms - $\gamma_{\it nat}$

Policymakers care about the national fiscal multiplier

$$Y_t^{nat} = nY_{Ht} + (1-n)Y_{Ft}$$
 &  $G_t^{nat} = nG_{Ht} + (1-n)G_{Ft}$   $S_t^{nat} = nS_{Ht} + (1-n)S_{Ft}$ 

- National policies come into play now ...
- ▶ Does a higher share of small firms also increase the national aggregate multiplier?  $\gamma_{nat} > 0$ ?

#### National multiplier and Small firms - $\gamma_{\it nat}$

▶ Does a higher share of small firms also increase the national aggregate multiplier?  $\gamma_{nat} > 0$ ?

$$\frac{Y_{t+1}^{nat} - Y_{t-1}^{nat}}{Y_{t-1}^{nat}} = \beta_{nat} \frac{G_{t+1}^{nat} - G_{t-1}^{nat}}{Y_{t-1}^{nat}} + \gamma_{nat} \frac{G_{t+1}^{nat} - G_{t-1}^{nat}}{Y_{t-1}^{nat}} \times \left(S_{t-1}^{nat} - \bar{S}^{nat}\right) + \eta S_{t-1}^{nat} + \epsilon_t$$

#### National multiplier and Small firms - $\gamma_{\it nat}$

▶ Does a higher share of small firms also increase the national aggregate multiplier?  $\gamma_{nat} > 0$ ?

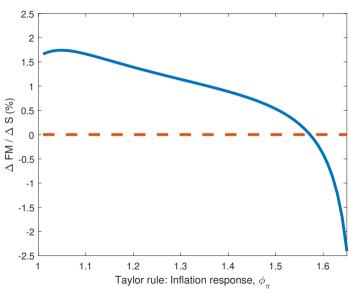

$$\frac{Y_{t+1}^{nat} - Y_{t-1}^{nat}}{Y_{t-1}^{nat}} = \beta_{nat} \frac{G_{t+1}^{nat} - G_{t-1}^{nat}}{Y_{t-1}^{nat}} + \gamma_{nat} \frac{G_{t+1}^{nat} - G_{t-1}^{nat}}{Y_{t-1}^{nat}} \times \left(S_{t-1}^{nat} - \bar{S}^{nat}\right) + \eta S_{t-1}^{nat} + \epsilon_t$$

▶ Answer:  $\gamma^{nat} = f(\phi_{\pi})$ 

$$\hat{R}_t = (1 - \rho_R)\phi_\pi \hat{\pi}_t + \rho_R \hat{R}_{t-1}$$

The larger the stabilization, the smaller the role of the financial accelerator

### National multiplier and Small firms - $\gamma_{\it nat}/\beta_{\it nat}$

#### **Conclusions**

- 1. Local fiscal multiplier increases with the share of small firms, implying multipliers of 0.95-2.15 in the interquantile range ( $\gamma^{macro} > 0$ )
- 2. Positive spillovers for small firms and neutral for large firms:
  - ▶ Small firms increase operating revenues, investment and financing by 5%-10% relative to large firms ( $\gamma^{micro} > 0$ )
- 3. Heterogeneity in firms' credit frictions shape the effectiveness of fiscal stimulus
- 4. Financial accelerator mechanism can account for 2/3 of the heterogeneous response in investment and 10-20% of the sensitivity of the local fiscal multiplier to the share of small firms
- 5. National fiscal multiplier increases with the share of small firms iff monetary policy does not respond much:  $\gamma^{nat} >> 0$  at ZLB
